Secure personal storage for staff is one of those workplace requirements that gets overlooked until the absence of it starts creating problems. Theft incidents, cluttered shared spaces, disorganised change rooms, and the general sense of a workplace that does not prioritise its people are all connected to inadequate staff storage. OzLoka® Australia's staff lockers address that directly, offering heavy duty polyethylene locker configurations suited to every Australian workplace, school, hospital, and industrial facility.

## **Staff Locker Configurations That Cover Every Industry Requirement**

The OzLoka® Australia's staff locker range spans multiple series designed around what staff actually need to store. The A-Series handles phones, keys, wallets, and daily personal items efficiently in a compact footprint. The B-Series offers extra depth for workplaces where staff store larger items alongside personal belongings. The C-Series is the widest configuration in the range, suited to sporting clubs, gyms, and workplaces where full sets of gear or protective clothing need to be stored comfortably within a single unit.

Every locker in the range is rotationally moulded from heavy duty polyethylene in a single-piece body. No welds, no seams, no structural weak points that fail under the sustained physical pressure of a busy staff change room. The non-porous surface resists the bacterial growth and odour that develop in metal lockers exposed to moisture over time. This offers a genuine hygiene advantage in healthcare, food service, and aquatic facility environments where compliance matters.

- Non-porous heavy duty polyethylene that resists mould, bacteria, and odour in moisture-heavy environments
- Hook and hang rail accessories available to keep uniforms and clothing properly stored and wrinkle-free
- Compatible with padlock, combination, coin-operated, and digital locking systems across all series
- Modular design that expands and reconfigures as the organisation's storage needs change over time

For workplaces across Australia's coastal regions, the material's complete resistance to salt air and humidity makes a practical difference that becomes obvious in the first few years after installation compared to metal alternatives in the same environment.

## **Why Organisations Across Australia Replace Metal with Heavy Duty Polyethylene**

The 15-year warranty on OzLoka® Australia staff lockers is not marketing language – it reflects genuine confidence in the durability of heavy duty polyethylene construction across Australian workplace conditions. Metal staff locker banks carry repainting, rust treatment, hinge replacement, and unit replacement costs that accumulate significantly over the same period. The switch to plastic removes most of those costs from the operational budget.
